Software Test Plan (STP)
QA Internship - Assignment #4

Fake Store API Testing

1. Introduction

To make sure the Fake Store API endpoint works correctly by using both manual (using POSTMAN) and automated testing(in C# using NUnit).

2. Scope

This document covers:

- Validation of HTTP response status code
- Validation of JSON response structure
- Verification of cart data accuracy

3. Prerequisites

- REST tool (POSTMAN)
- Knowledge of HTTP methods and JSON .

4. Test Environment

Tool: Postman

Method: GET

Endpoint: https://fakestoreapi.com/carts/5

Expected Response Format: JSON

5. Test Scenarios

1. **TS#1**: Verify response status code is 200
2. **TS#2**: Verify response contains cart ID = 5
3. **TS#3**: Verify cart contains at least one product

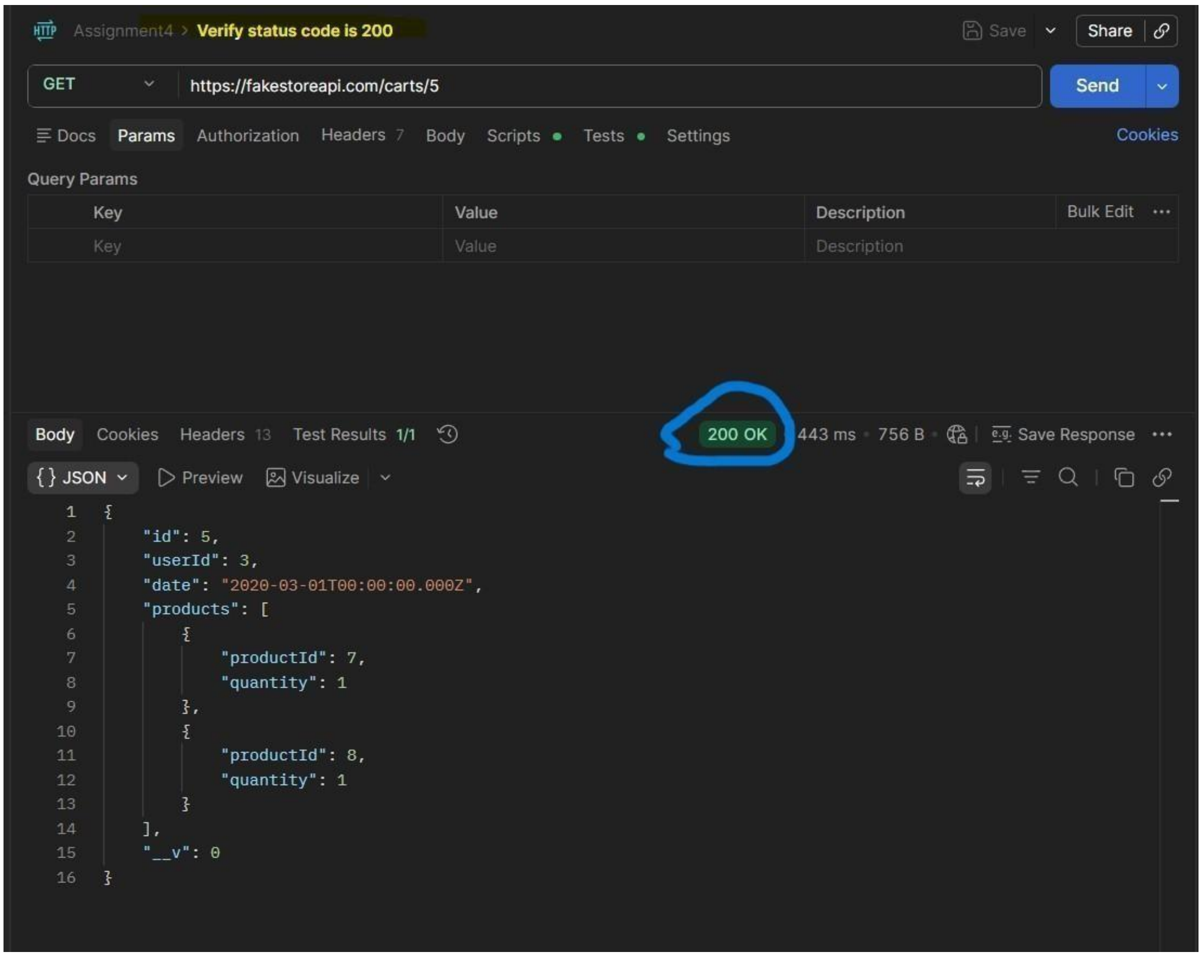
6. Test Cases

TC#1: Verify Status Code

Steps:

1. Open Postman
2. Select GET method
3. Enter the endpoint URL
4. Click Send

Expected Result: Status code :200 OK

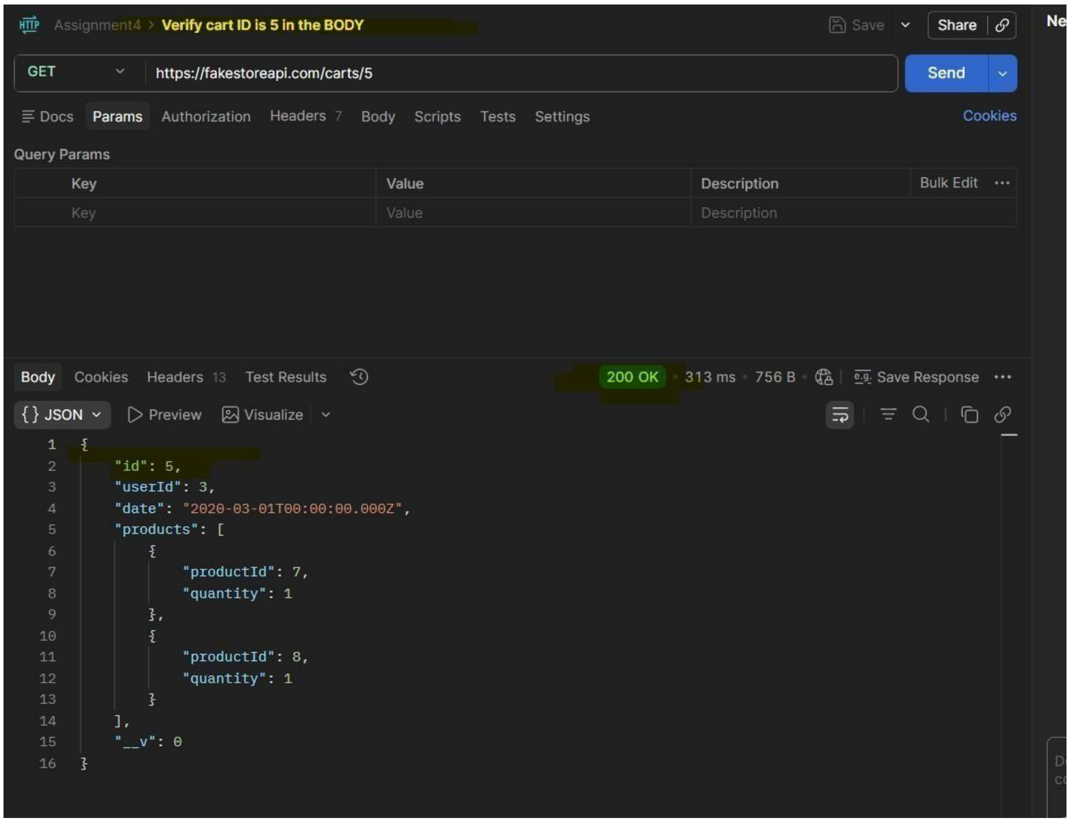


TC#2 : Verify Cart ID

Steps:

1. Send GET request
2. Check response body

Expected Result: JSON contains "id": 5

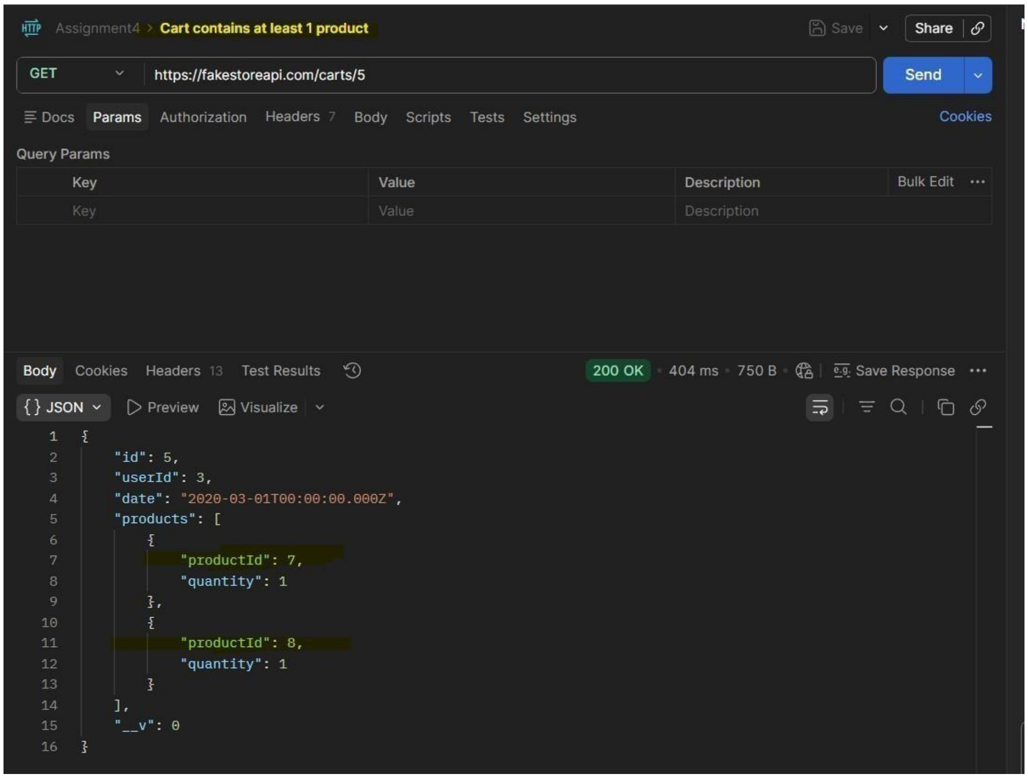


TC#3 : Verify Cart Contains Products

Steps:

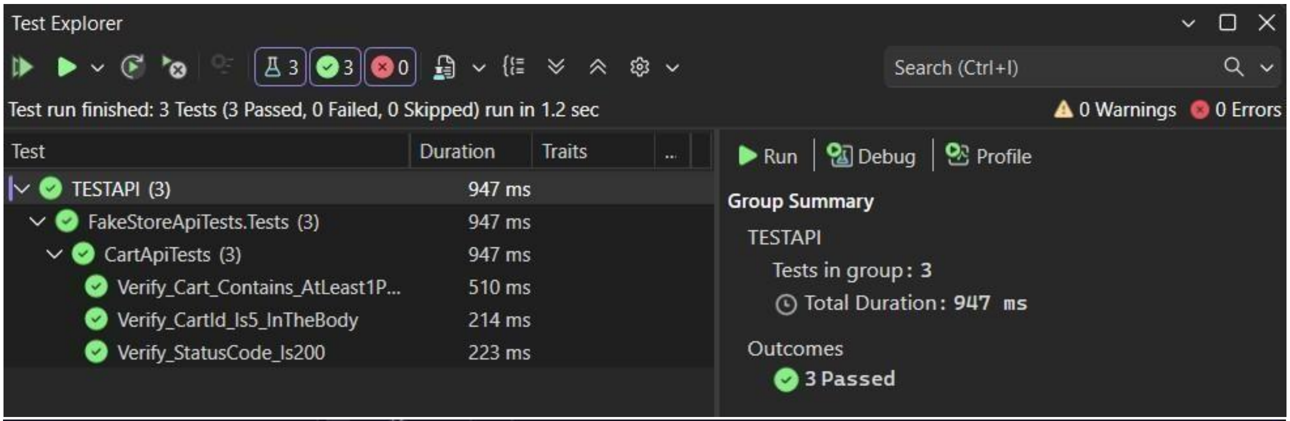
1. Send GET request
2. Inspect 'products' array

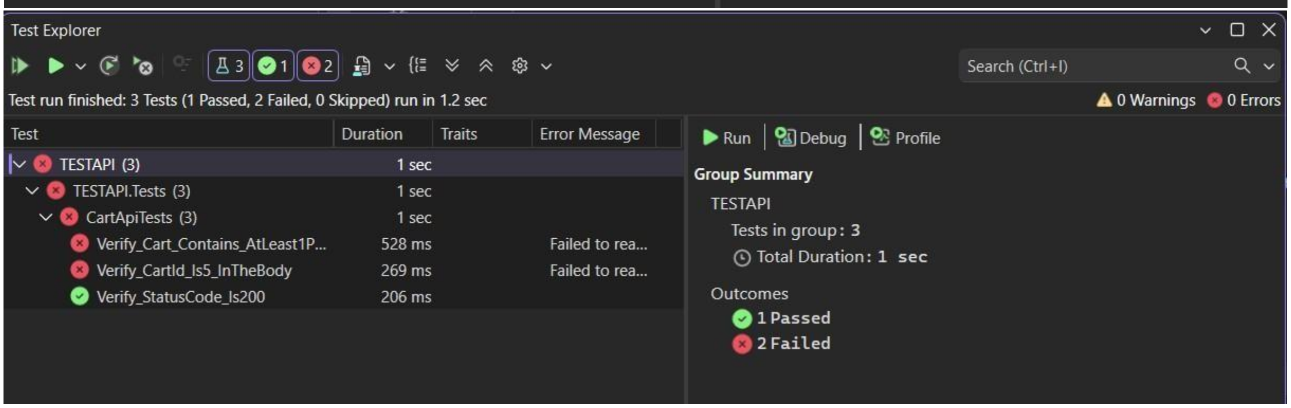
Expected Result: 'products' exists and contains at least one product



7. Pass / Fail Criteria

A test case is considered **PASS** when the actual outcome aligns with the expected result. A test case is considered **FAIL** when the actual outcome does not match the expected result.





8. Risks

- API server may be unavailable
- Network issues may affect results

9. Conclusion

This test plan ensures that the Fake Store API endpoint behaves correctly and returns valid structured data as expected.
